

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

between the equations of a surface of the second order and of its tangent plane, as found by Sir William R. Hamilton in his geometrical applications of the Calculus of Quaternions, that Mr. Graves was led to investigate the theorem now communicated to the Academy.

The following theorem respecting ellipsoids, obtained by the method of quaternions, was communicated by Sir William Rowan Hamilton, in a note to the Secretary of Council :

“ On the mean axis of a given ellipsoid, as the major axis, describe an ellipsoid of revolution, of which the equatorial circle shall be touched by those tangents to the principal section of the given ellipsoid (in the plane of the focal hyperbola), which are parallel to the umbilicar diameters. In this equatorial circle, and in every smaller and parallel circle of the new ellipsoid thus constructed, conceive that indefinitely many quadrilaterals are inscribed, for each of which one pair of opposite sides shall be parallel to the given umbilicar diameters, while the other pair of opposite sides shall be parallel to the asymptotes of the focal hyperbola. Then *the intersection of the first pair of opposite sides of the inscribed quadrilateral will be a point on the surface of the given ellipsoid.*

“ I may remark that the distance of either focus of the new ellipsoid from the common centre of the new and old ellipsoids, will be equal to the perpendicular let fall from either of the two points, which were called t and v in a recent note and diagram, on the umbilicar semidiameter au , or on that semidiameter prolonged; while the distance of the umbilic u from the foot of either of these two perpendiculars, that is, the projection of either of the two equal tangents to the focal hyperbola, tu , uv , on the umbilicar semidiameter au , or on that semidiameter prolonged, will be the minor semiaxis, or the radius of the equator, of the new ellipsoid (of revolution).

“ This new ellipsoid *touches* the old one at the ends of the given mean axis ; but it also *cuts* the same old or given ellipsoid, in a system of two ellipses, contained in planes perpendicular to the asymptotes of the focal hyperbola.

“ If the semiaxes of the given ellipsoid be a, b, c , the common distance of the two *foci* of the new or derived ellipsoid (of revolution) from the common centre of the two ellipsoids, is expressed by the formula

$$e = \frac{\sqrt{(a^2 - b^2)} \sqrt{(b^2 - c^2)}}{\sqrt{(a^2 - b^2 + c^2)}}. \quad (1)$$

“ And I venture, although with diffidence, to propose the name of the TWO MEDIAL FOCI, for the two points thus determined on the mean axis $2b$ of the ellipsoid a, b, c . If their vectors be denoted by $\pm \epsilon$, the equation of that original ellipsoid may be thus written :

$$T(\lambda_1 + \epsilon) + T(\lambda_1 - \epsilon) = 2b; \quad (2)$$

or thus,

$$T(\lambda_1 - \epsilon) = b + b^{-1} S. \epsilon \lambda_1; \quad (3)$$

where

$$\lambda_1 = \frac{\rho\eta - \theta\rho}{\eta + \theta}; \quad \epsilon = \frac{2V \cdot \eta\theta}{T(\eta + \theta)}; \quad (4)$$

η, θ, ρ , having the same significations as in notes recently read ; while e may perhaps be called the MEDIAL EXCENTRICITY of the ellipsoid abc .

“ In a future communication I may be induced to return on the quaternion analysis employed, and to submit to the Academy some account of it.”

Mr. M. Donovan concluded his paper on the Universal Vitality of Matter.

He remarked, that the title of his paper on the Universal Vitality of Matter had led some persons to imagine that he believed every kind of matter to be endued with life, understood in the common acceptation of the word, than which
